Usage Manual

HIGHLIGHTS

- Display asset location and movement in real-time
- Records information on events including information from integrated systems
- Reports that shows historic information on asset movement
- Add controls to standard Tracking software
- Use defined events to trigger multiple actions
- Automate functions
- Control access and departures
- Save time and Money

NEAT Enterprise – Complex Asset Tracking

NControl is pleased to offer a new concept in RFID solutions, *NEAT Enterprise*. NControl's solution includes a pre-configured server with all asset tracking and reporting applications included.

The *NEAT Enterprise* system is used in conjunction with our *NEAT* product to monitor Asset Movement in multiple locations. The *NEAT* systems are installed at each location and all asset movement information is forwarded to the *NEAT Enterprise* system. Users have one system that can provide asset information for all monitored locations.

The *NEAT Enterprise* system is designed to track and monitor assets that are moved from location to location. The system will monitor the asset movement at one location then will automatically start tracking the asset when it arrives at the next location.

NEAT Enterprise makes its information available via a constantly updated web-based reporting system. All Asset Definition and system setup can be performed in the *NEAT Enterprise* system and the information will be forwarded to each local *NEAT* system. Users can access the *NEAT Enterprise* at each location to monitor local activity or to view activity complex wide.

Use *NEAT Enterprise* to:

- Shows asset location instantly
- Cause a defined action when an event occurs and record all event activity
- Use rule sets to make decision based on different events.
- Search for event activity by location or assets involved.
- Combine multiple actions with a single event.
- Automate manual functions and save money and resources.

All of *NEAT* subsystems and devices can be used in conjunction with *NEAT Enterprise*. These include the *NEAT Alarm Service* that is used to generate workstations alarms, *NEAT NContact* which can activate a video camera, *NEAT NGate* which is used to control access and *NEAT NVision Web* that uses a customer supplied map to display the location of assets based on established areas.

There are options that can be used to enhance the functionality of *NEAT Enterprise*.

NEAT Tablet Viewer – The Tablet Viewer allows users to view asset location information and historic information on any web-capable mobile device.

NEAT Watchdog can be used to monitor the network connection for RFID readers, external *NEAT* devices or input connections from third-party Applications. The service is designed to monitor all input connections to the *NEAT* system and alarm if a connection is lost.

For additional information on *NEAT Enterprise* please contact NControl Security Integrations, LLC at either sales@ncontrolsi.com or via telephone at (219) 285-0141.
